

ExpressJS : Authentication

User Name

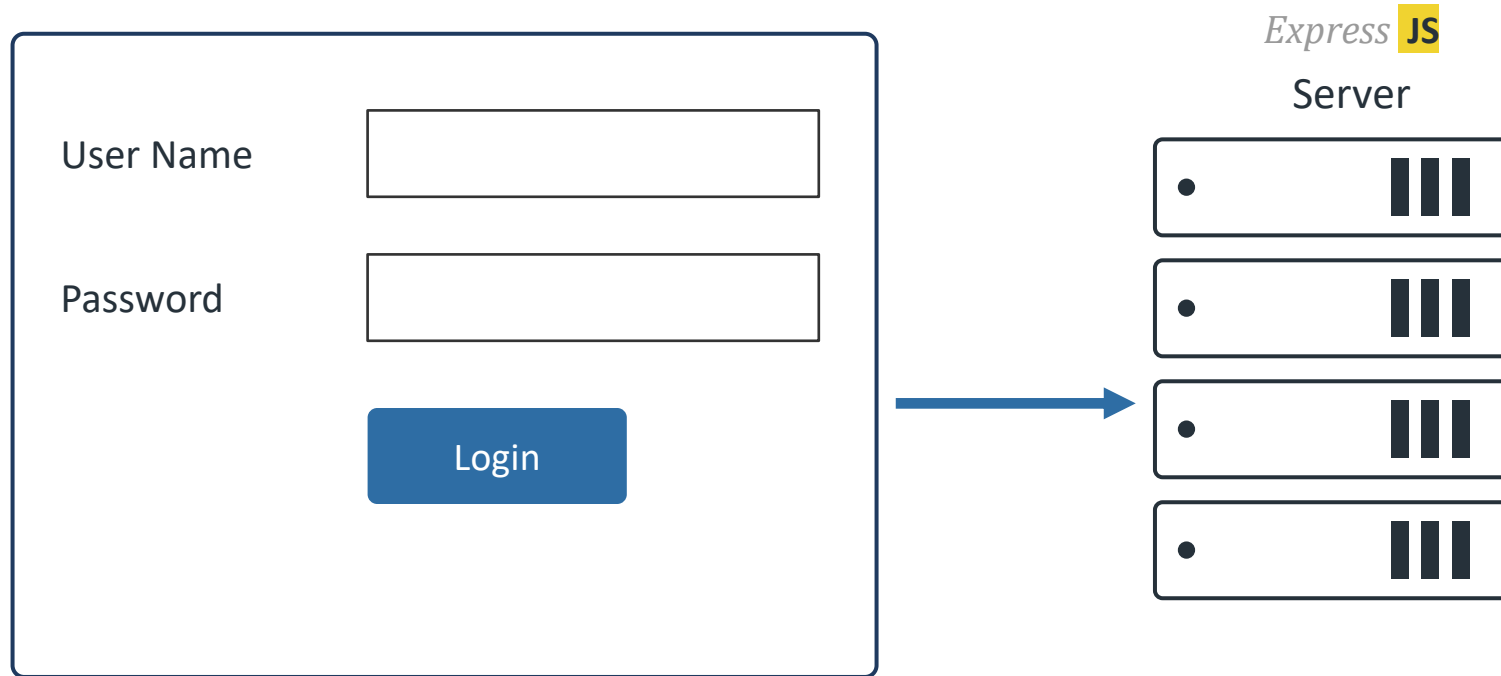

Password

Login

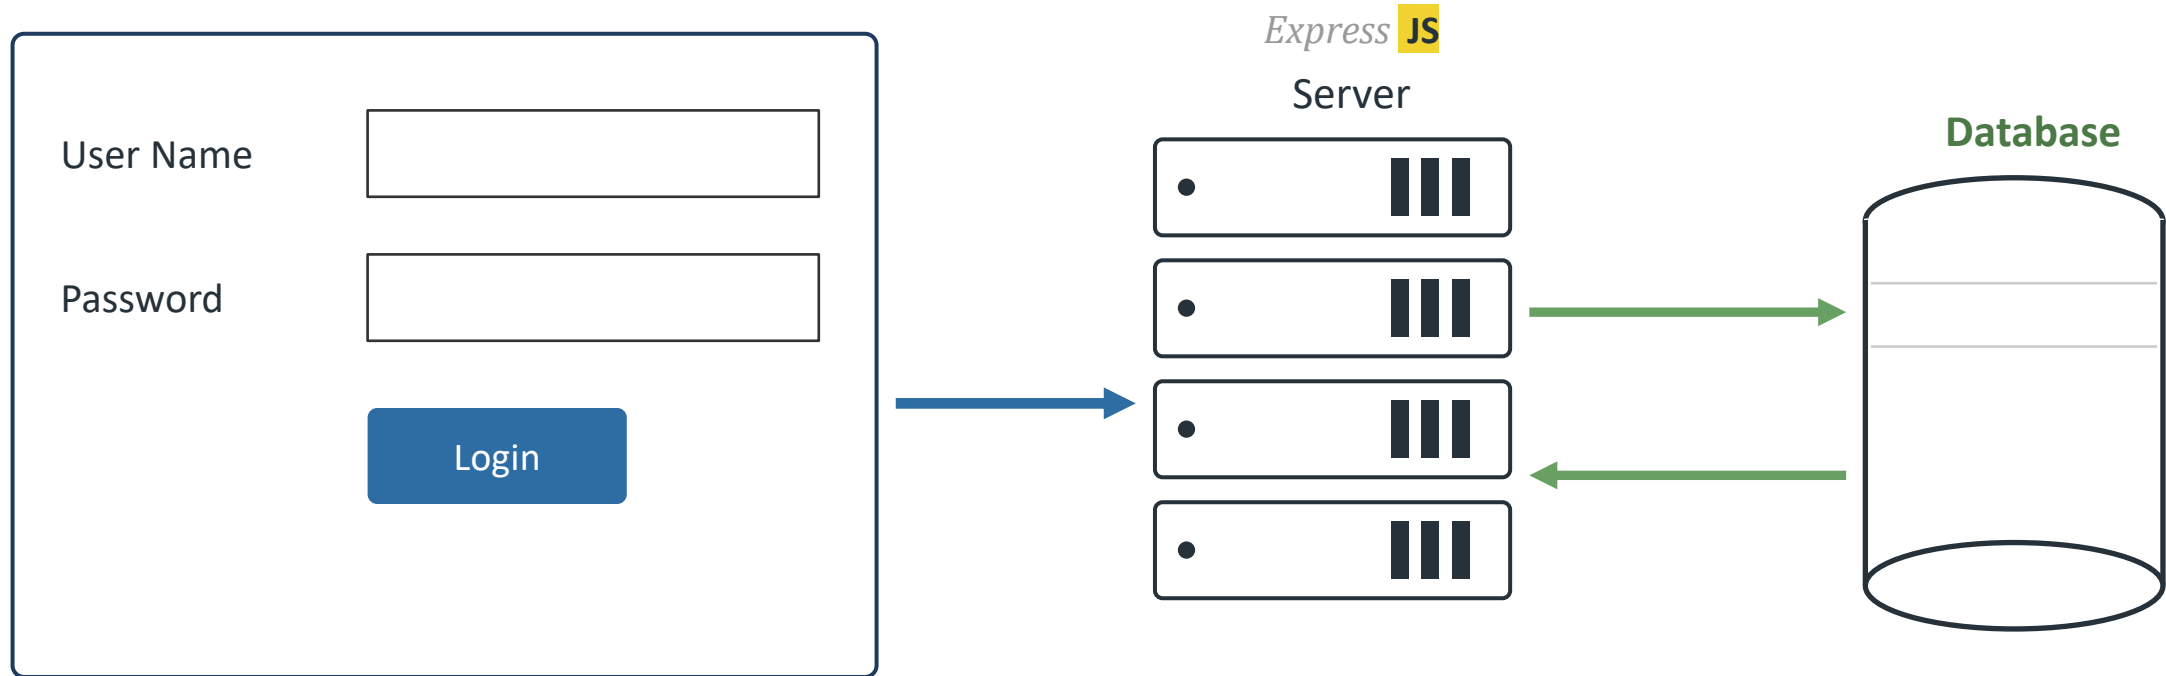

Every authentication flow starts with a simple login form — a username and a password.

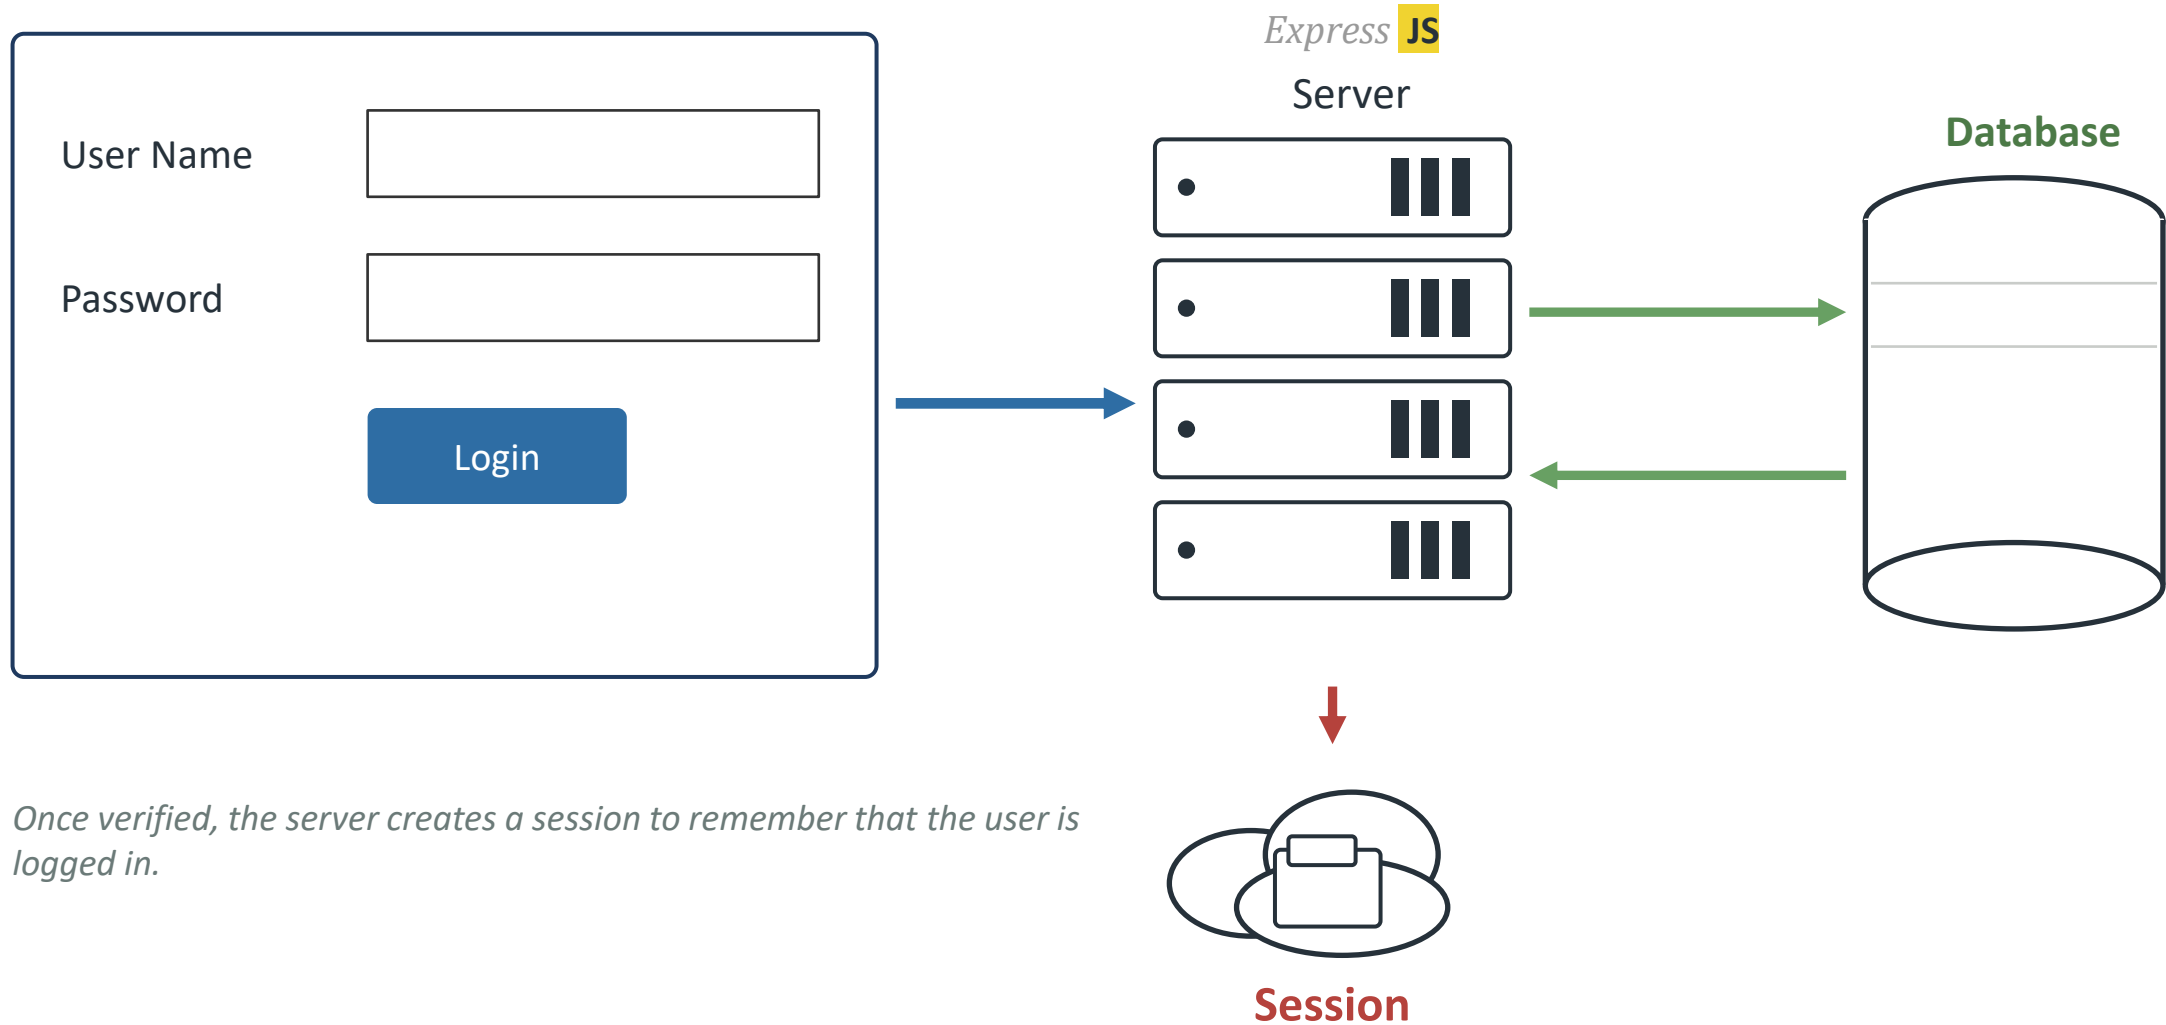

ExpressJS : Authentication

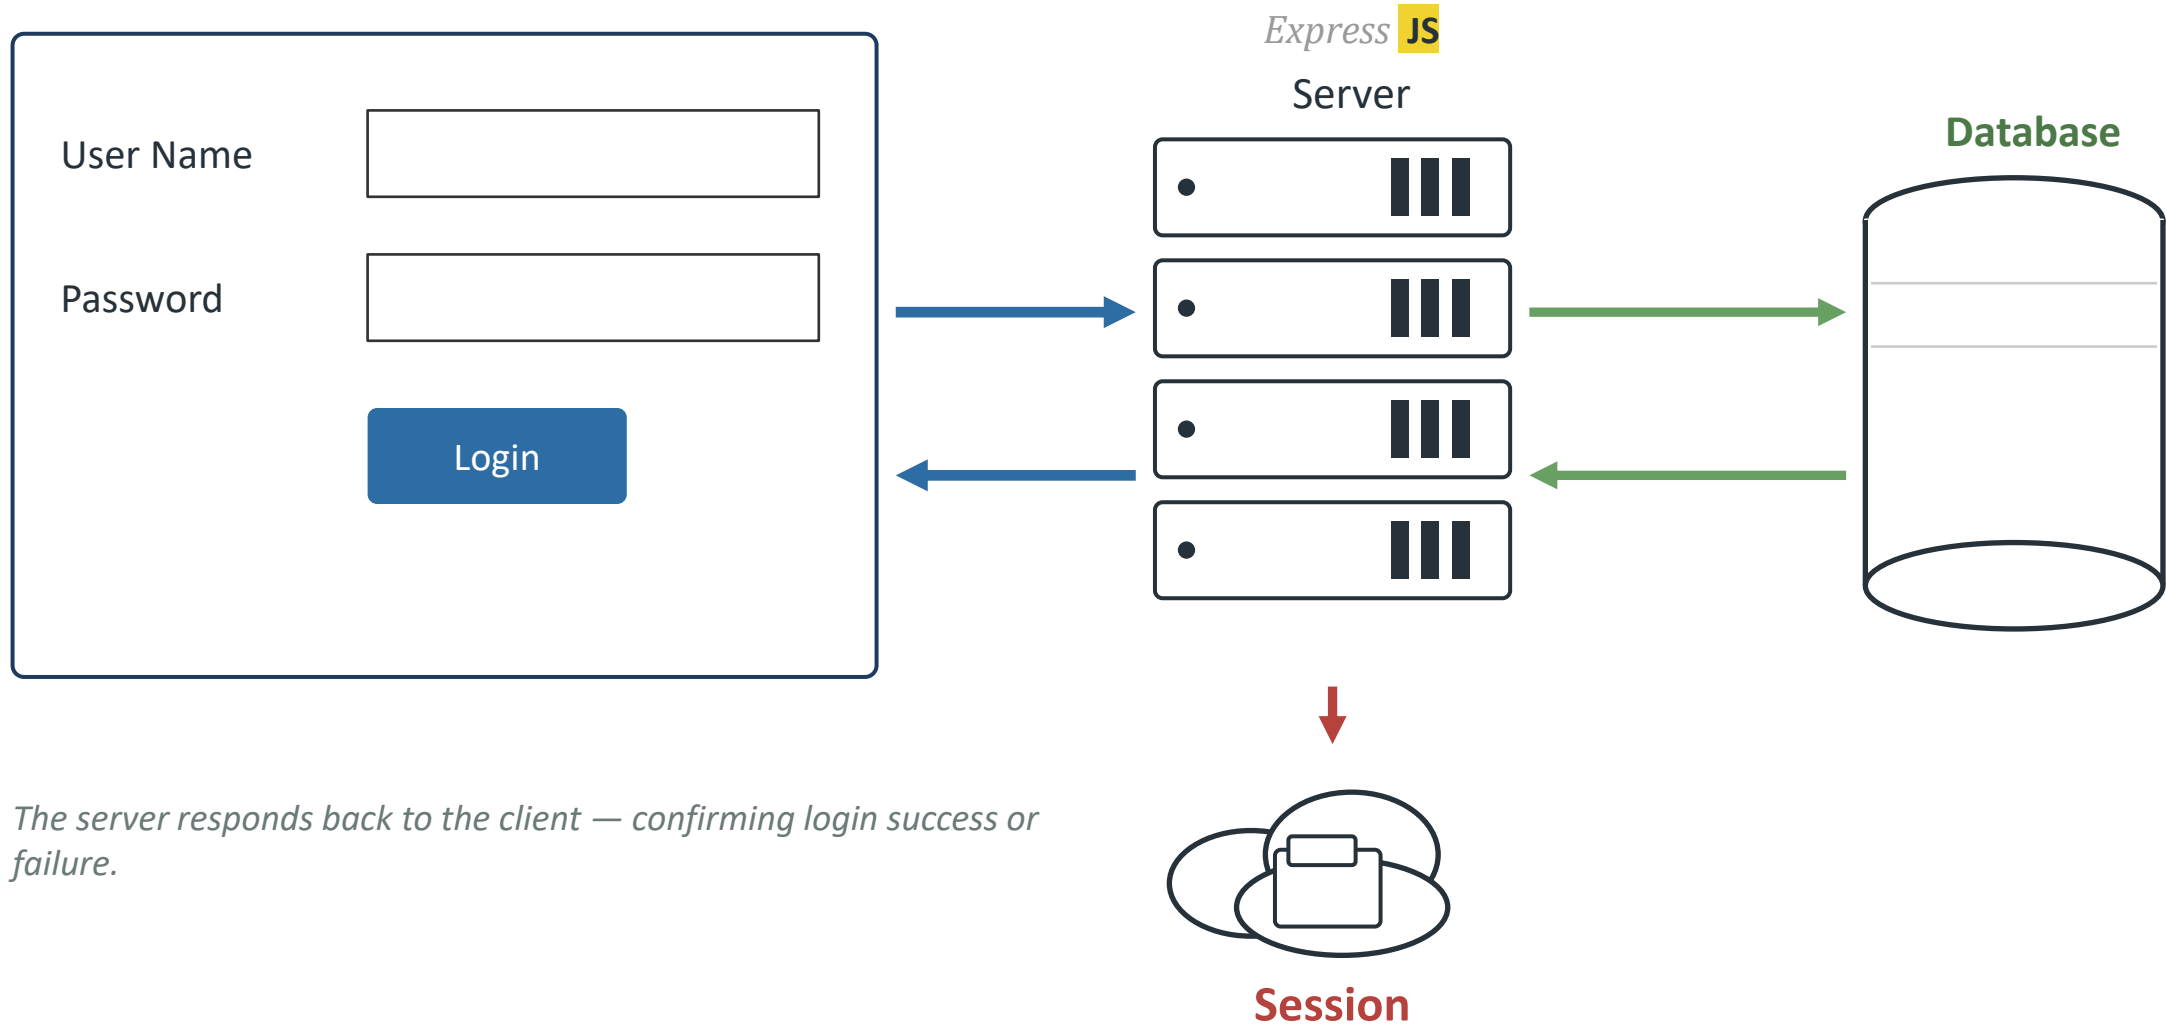

The submitted credentials travel from the client to the ExpressJS server.

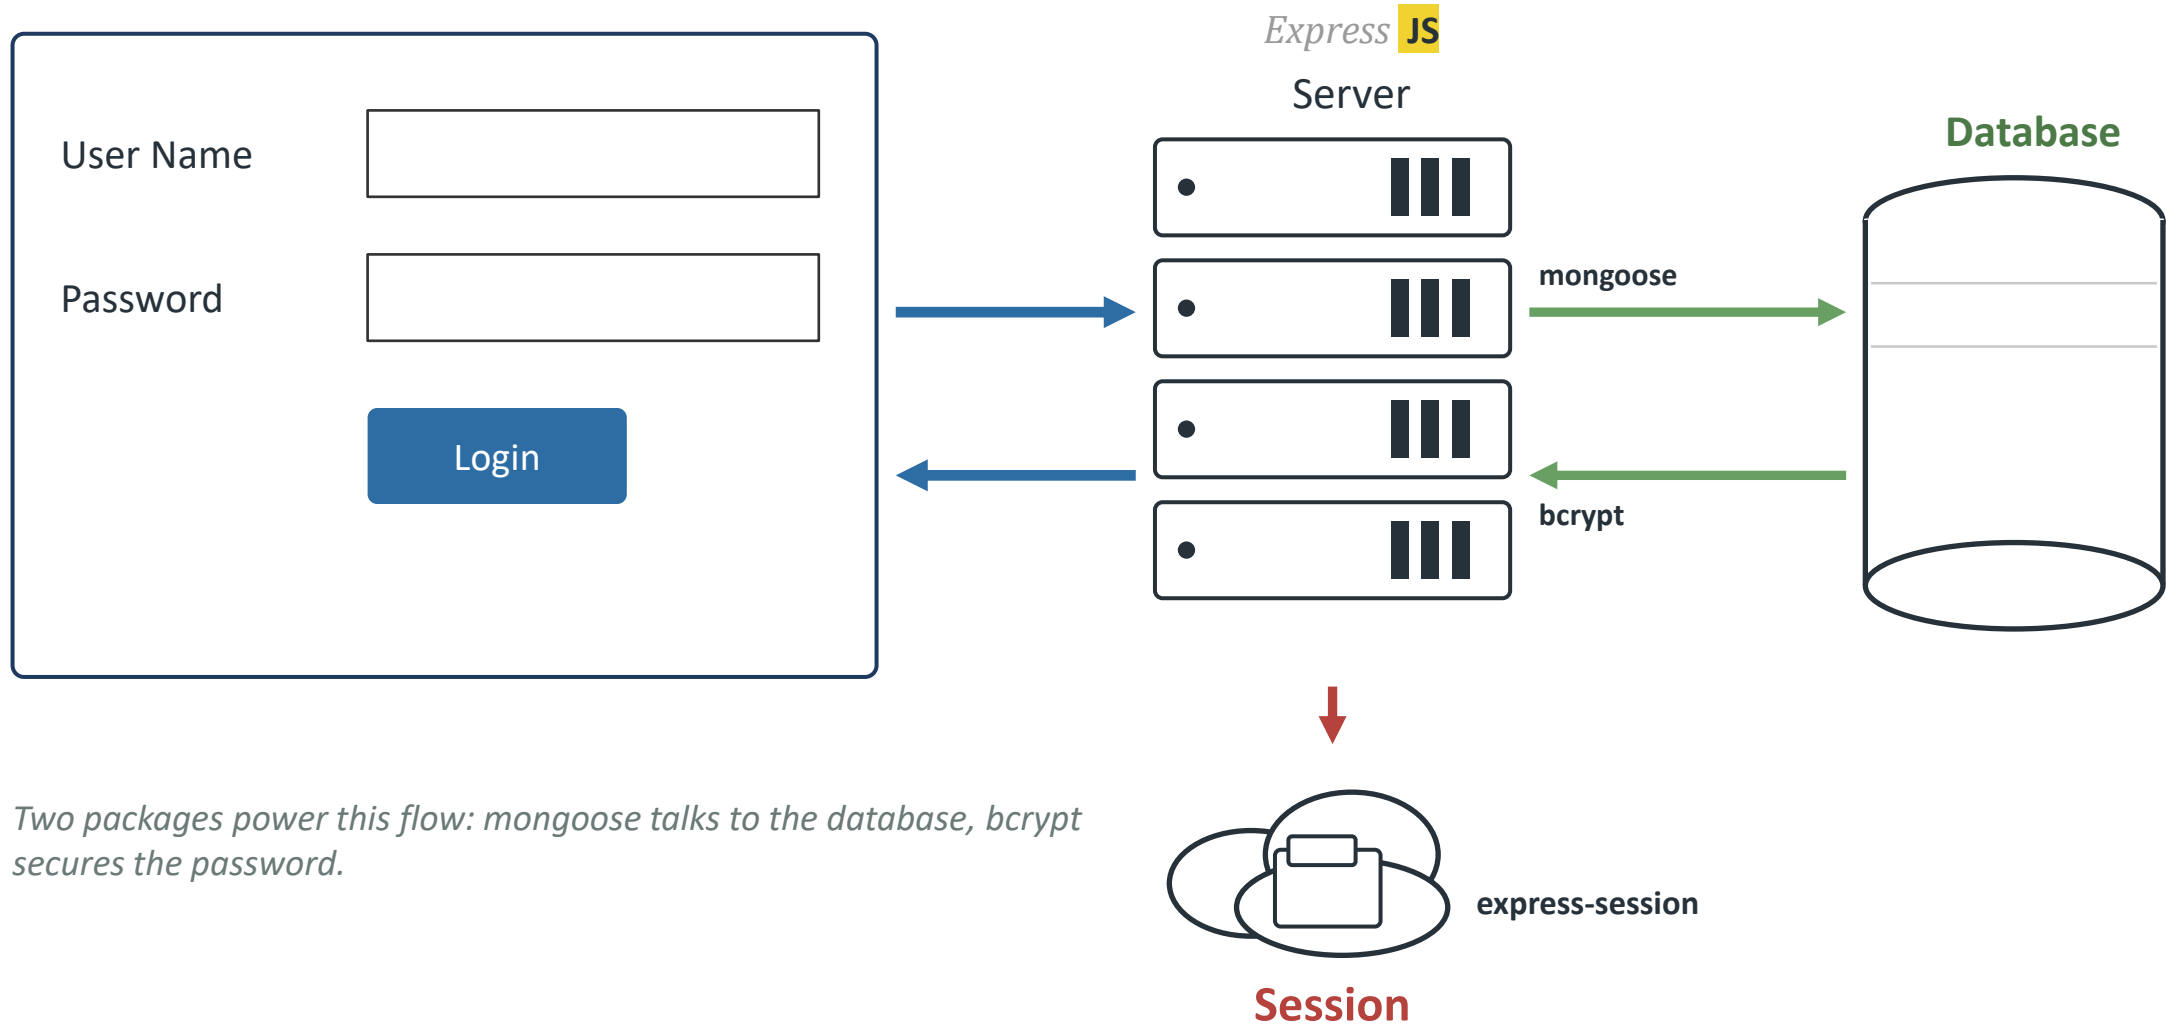

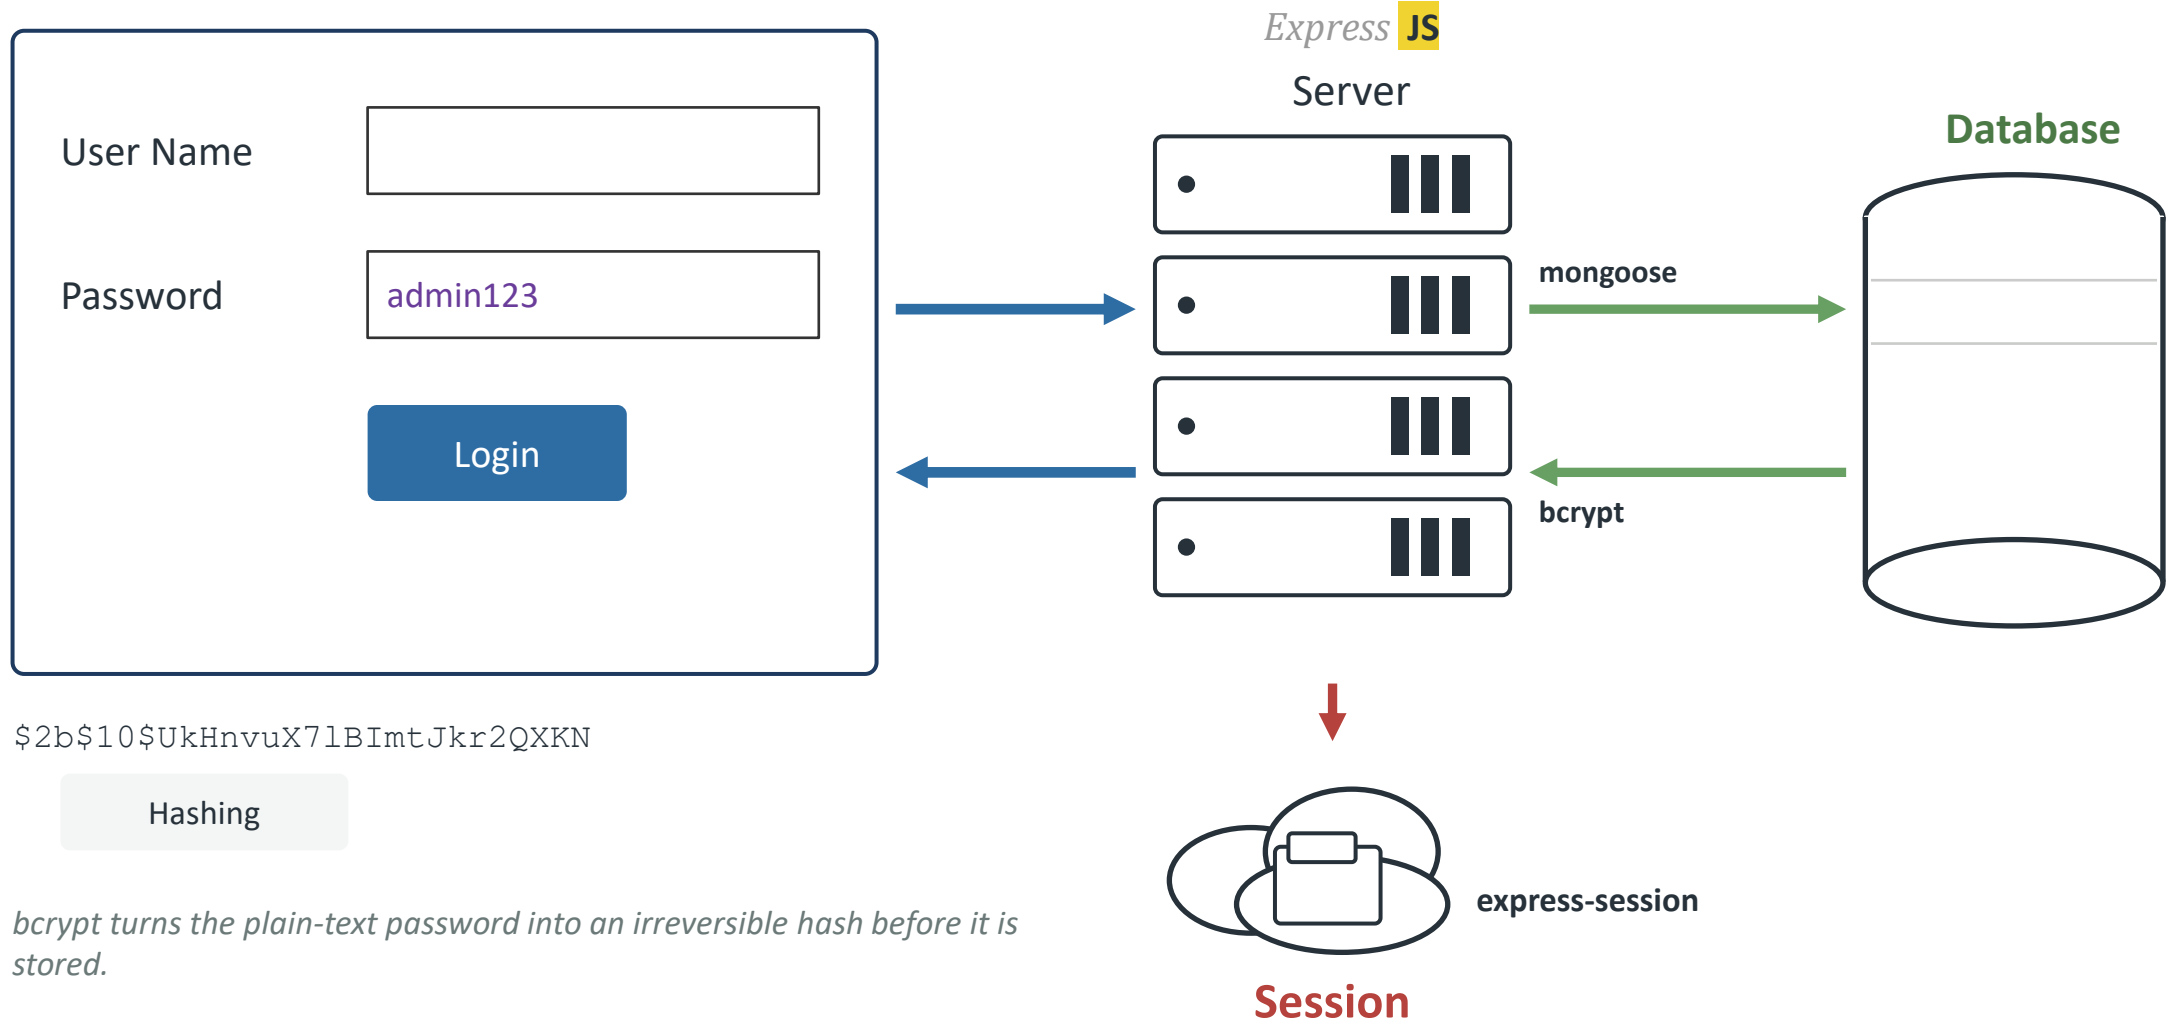

The server checks the submitted username and password against the database.

ExpressJS : Authentication

ExpressJS : bcryptjs Package

1

```
npm install bcryptjs
```

2

```
const bcrypt = require('bcryptjs');
```

3

```
const hashedPassword = bcrypt.hash(password, 10);
```

What bcryptjs does

- Installs as a plain npm package — no native build tools required
- hash() converts a plain-text password into a secure, irreversible hash
- The second argument (10) is the salt rounds — higher means slower but stronger
- The same hash is later checked with bcrypt.compare() at login
